Some of my language, things like "Open GL" and "fighting NULL" and so on, you can skip it and be fine I think.

I'm not saying that software is terrible, though. On the contrary, people do amazing things. I was just glad to not be fighting NULL. (To me, fighting NULL is the exitone of why I struggled as a programmer. I am not a natural at it, but I wanted very much to be - and I found no use for NULL. I never needed it, but it was always there. I kept
pushing it down, painting over it, shutting
it up, constantly checking for it—
"The you NULL? are you NULL? what
about you?"—and sometimes I would
deceive myself that my problems
were other things but them NULL! were other things, but then NULL would pop up, I would find that it was the cause - however, NULL is never really the cause. It is someone you always pur into in bad situations, someone you herek want to see. NULL ponetrates sky, helplessly, "Looks like you're having a problem. Endemic to the problem, not the problem, complicit, and might be the problem.)
